AMISTCO® METAL HEX GRID REFRACTORY LINING

AMISTCO® Metal Hex grid provides a surface framework to anchor and reinforce cement or refractory in linings and floorings. The hexagonal grating can be rolled to accommodate the contours of vessels and simplifies the application of linings. After the lining is applied the effective service life of the refractory lining is greatly extended because the AMISTCO® Metal Hex Grid provides added structural support and improves heat erosion and abrasion resistance.

Standard AMISTCO® Metal Hex Grid is available in 304 SS materials. Other materials are available upon request.

Typical applications include:

- Reactor vessels
- Furnaces
- Ducts
- Cyclones
- Flue gas lines

AMISTCO® Separation Products Inc. manufactures a full line of tower internals, mist eliminators and other components critical to effective mass transfer and separation.

For more details regarding these products, visit our website or consult with an AMISTCO® Separations representative.
